

Database lab:

In C: to access the database, use the credentials in the picture below:

Dbname=ewis, host=ekleer.pld.ttu.ee, user=read_ewis, password=RO-A11ik45-2022

Make sure that no one writes the password as RO-Allik45-2022 <- it is a common mistake

Only Estonian database works, so only Estonian field names work, half the examples use English fields and another half uses a mix, you have to be careful with those.

Name = joenimi, length_km = pikkus_km etc

Table names are also incorrect, the main one is joe_andmed, second one is seire_jogi_hydrol_jaamad and last one is seire_jogi_hydrol

Linux terminal can be used to access the database (only way now, no mywebsql anymore).

In school computer, you can use the following command in terminal to log into the database:

```
psql --set=sslmode=require -h ekleer.pld.ttu.ee -U read_ewis ewis
```

use same pw as above: RO-A11ik45-2022

command \dt gives all table names (we only need the 3 mentioned above)

using \d TABLE_NAME you can see all fields for the chosen table (useful to see the correct field names)

Note that all tables seem to have been doubled (all data is doubled inside them)

Also, in joe_andmed, id_jogi is 10x bigger than in seire_jogi_hydrol_jaamad.

When you have to compare them, divide joe_andmed.id_jogi by 10

Example: IN joe_andmed.id_jogi/10 = seire_jogi_hydrol_jaamad
